

LECTURE 10:

CODE OF ETHICS

This lecture focused on code of ethics and professional responsibility.

I learned that code of ethics means a set of rules and values that guide a person to behave honestly, responsibly, and respectfully in professional situations.

As a Software Engineering student, ethics is very important because I may work with user data, software systems, websites, databases, and company information in the future.

This lesson helped me understand that an IT professional should not only have technical skills, but also honesty, responsibility, confidentiality, and respect for

HOW I CAN PRACTICALLY APPLY IT

I can apply code of ethics in my studies, projects, internship, and future workplace.

In academic work, I should avoid plagiarism and submit my own work honestly.

In software projects, I should protect user data and use databases responsibly.

In teamwork, I should respect team members, share work fairly, and communicate honestly.

In the workplace, I should follow company rules, protect confidential information, and behave professionally.
